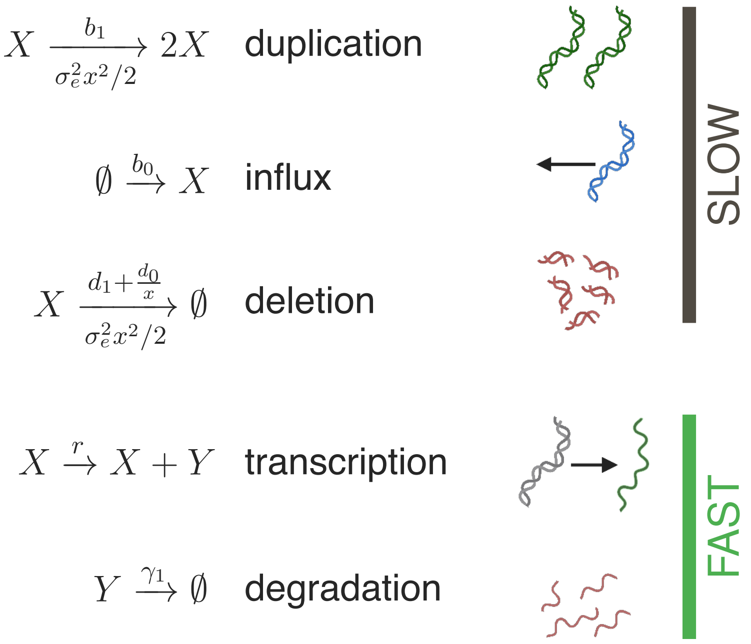
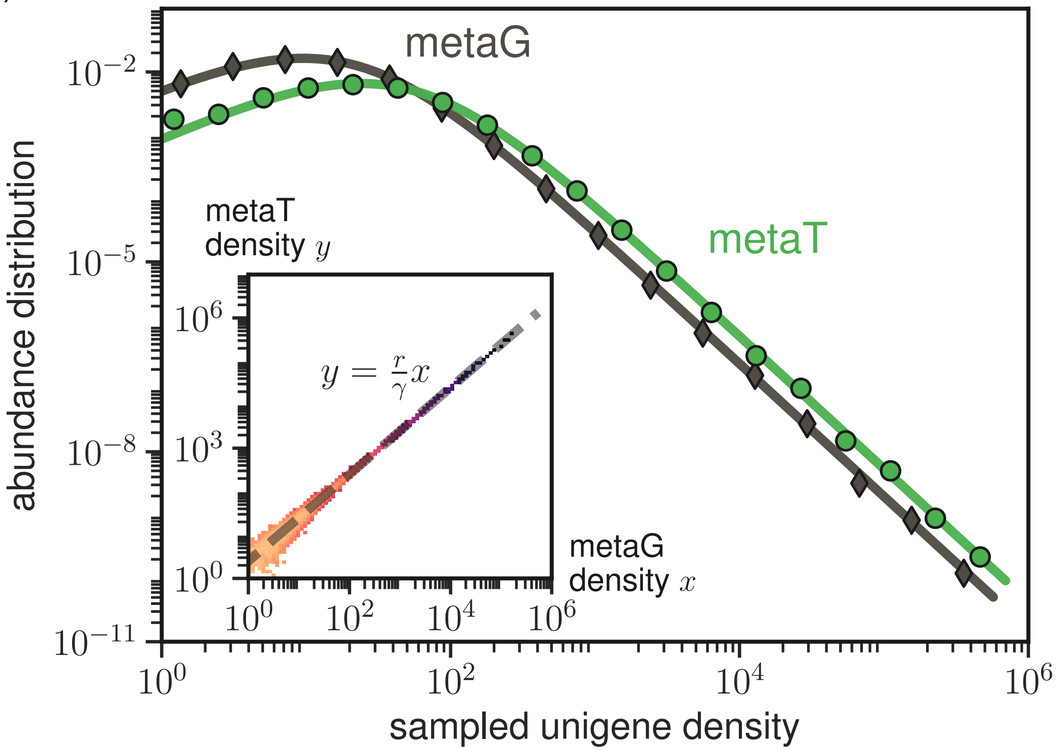
(A)



(B)



(C)

	stationary abundance distribution
metaG	$P(x) = \mathcal{N} x^{-1+\zeta_G} \left(k_G + x\right)^{-1-\alpha_G-\zeta_G}$
metaT	$P(y) = \mathcal{N} y^{-1+\zeta_T} \left(k_T + y\right)^{-1-\alpha_T-\zeta_T}$

	metaG	**metaT**
characteristic scale	$k_G = \frac{b_1+d_1}{\sigma_e^2}$	$k_T = k_G \frac{r}{\gamma}$
tail exponent	$\alpha_G = 2\frac{d_1-b_1}{\sigma_e^2}$	$\alpha_T = \alpha_G$
crossover exponent	$\zeta_G = 2\frac{b_0-d_0}{b_1+d_1}$	$\zeta_T = \zeta_G$
